ADAPTING TO THE CUSTOMER'S NEEDS

Each customer has their own specific requirements and ideas. In dealing with a variety of customers in many different fields, we have become accustomed to tailoring each solution to those specific requirements.

ArborText's Epic Editor Suite and Enigma are used for assimilating legacy data or developing from scratch for SGML, HTML, or XML authoring tasks. These formats are then converted into IETM formats for CD-ROM delivery or Web-based applications.

AutoCad, as well as many other graphic editing programs, such as Illustrator, are used to develop pure vector graphics that can be imported into and/or converted for use within our various document development tasks or IETM applications. Drawings from 'A' size to 'H' size can be scanned, converted, plotted in black and white or color.
